# Process Calculation

2

↳ Unit operation — physical

↳ Unit process — Chem

Raw — System — Final.

## Units & Dimensions :-

Dimensions :-

eg:- length, mass, temp, volume, velocity.

Physical variables required to define the nature & characteristic of the nature system or object.

↳ Primary — (fundamental) → Independent dimension & measurable. time, length, mass, temp etc.

↳ Secondary — (Derived) → Combination of fundamental dimension. volume, speed, density.

Units :-

To characterize (define) the dimensions.

time → sec, hrs, min, yrs, days

Mass → Kg, g, lb

temp → K, R, °C, °F

Unique units are associated with unique dimensions.

System of Unit	mass	time	temp.	length
↳ MKS System (metric system)	Kg	Sec	°C	m
↳ FPS system	lb	Sec	°F	ft
↳ CGS System	g	sec	°C	cm
↳ SI System (System International)	Kg	Sec	K	m
Dimension	M	T	or $\theta$ K	L

Q.7 The flow rate of water through a pipe is reported as 15 ft<sup>3</sup>/min. The density of water is 1 g/cm<sup>3</sup>. Calculate the mass flow rate kg/s?

$$m^{\circ} = 15 \frac{\text{ft}^3}{\text{min}} \times 1 \text{ g/cm}^3$$

$$= 15 \frac{\text{ft}^3}{\text{min}} \times \frac{\text{g}}{\text{cm}^3} \times \frac{1 \text{ min}}{60 \text{ sec}} \times \frac{1 \text{ kg}}{1000 \text{ g}} \times \frac{(0.3048 \text{ m})^3}{1 \text{ ft}^3} \times \frac{1 \text{ cm}}{(10^{-2})^3}$$

$$= 7.079 \text{ kg/sec.}$$

Q.7 In SI system, thermal conductivity has the unit of W/m. For a solid material thermal conductivity is given by  $K = \frac{\kappa \cdot Q}{A \cdot \Delta T}$ . where  $Q$  = rate of heat transfer,  $\kappa$  thickness of material,  $A$  = cross-sectional area,  $\Delta T$  - temp diff. For an experiment the values are found to be  $Q = 10000 \text{ KJ/h}$ ,  $A = 1 \text{ m}^2$ ,  $\kappa = 100 \text{ mm}$ ,  $\Delta T = 800 \text{ K}$ . Calculate

i.  $K$  in W/mK

ii.  $K$  in Kcal/mh°C

i.

$$K = \frac{100 \text{ mm} \times 10000 \text{ KJ/h}}{1 \text{ m}^2 \times 800 \text{ K}}$$

$$= \frac{10^6}{800} \frac{\text{mm} \times \text{KJ}}{\text{h} \times \text{m}^2 \times \text{K}} \times \frac{10^{-3} \text{ m}}{1 \text{ mm}} \times \frac{1 \text{ hr}}{3600 \text{ sec}} \times \frac{1000 \text{ J}}{1 \text{ KJ}}$$

$$= 0.347 \text{ W/mK.}$$

2.

$$0.347 \frac{\text{J}}{\text{msK}} \times \left( \frac{1 \text{ Cal}}{4.1858 \text{ J}} \right) \times \left( \frac{3600 \text{ sec}}{1 \text{ hr}} \right) \left( \frac{1 \text{ K}}{1^\circ \text{C}} \right)$$

$$298.628 \text{ Cal/mh}^\circ \text{C}$$

$$0.29862 \text{ Kcal/mh}^\circ \text{C}$$

$\Delta \text{diff}$   
 $\Delta T = \text{K}$
